

HS aqua

New!

HS aqua *Nano* Marin

Meet HS aqua Nano Marin. A new product line from HS aqua consisting of bacteria and water treatment products especially for small marine aquariums (up to 200 litres).

New!

With the HS aqua Nano Marin line you can enjoy a colourful marine aquarium with small saltwater fish, corals and invertebrates without having to master the complicated marine aquarium techniques normally reserved for advanced aquarium hobbyists.

HS aqua Bacto Nano Marin and HS aqua Denibac Nano Marin are bacteria cultures used for the natural filtration of saltwater aquariums. The bacteria in HS aqua Denibac Nano Marin also reduce nitrate and sludge which can be harmful to most invertebrates and also cause algae growth.

HS aqua Denifood Nano Marin is a source of energy for bacteria in live coral and/or denitrators for a more rapid breakdown of nitrate. Nitrate is often the cause of algal growth and poor growth rates in invertebrates.

HS aqua KH Plus Nano Marin raises the carbon hardness of the water.

HS aqua Mineral + Ca Nano Marin contains all of the necessary trace elements and calcium required to guarantee good growth in corals and anemones. At the same time, Mineral + Ca Nano Marin keeps the water quality stable.

Use HS aqua Mineral + Ca Nano Marin in combination with HS aqua KH Plus Nano Marin to keep the water's buffering capacity at the right level.
